SUMMARY

Cloud engineer with 5+ years of experience building a multi-cloud FinOps platform that covers $500M+ in annual spend: cost data pipelines, waste detection and CI/CD on Azure and GCP. Builds AI tools and agentic coding workflows, using tool use, structured output and evals.

WORK EXPERIENCE

Capgemini India — Aug 2021 – Present

Consultant | Jan, 2025 – Present — *Bangalore, India*

- Core engineer on a multi-cloud FinOps platform (AWS, Azure, GCP, OCI, plus SaaS and AI spend such as Snowflake, Datadog, Anthropic and OpenAI) providing cost visibility and waste detection over $500M+ in annual spend; wrote and owned the Azure and GCP integrations.
- Owned the implementation of the platform's GCP integration: built the event-driven cost ingestion, normalization and metadata pipeline (Cloud Functions, Pub/Sub, BigQuery) feeding the AWS hub, powering GCP cost-and-usage, chargeback and commitment-tracking reports; deployed through Terraform and GitHub Actions CI/CD.
- Leading the end-to-end integration of a sovereign GCP cloud (EU), designing the data-flow boundary so cost reporting stays compliant with EU data-residency rules.
- Extended the platform to Azure Government (FedRAMP): re-architected the cost export to serve commercial and Government tenants from one pipeline, bringing cost visibility and waste detection to Government workloads.
- Led and mentored 7 junior engineers and interns across India, the US and Canada: scoped features, wrote technical designs and acceptance-criteria stories, assigned and guided their work, and onboarded them onto the platform.

Associate Consultant | Jan, 2023 – Dec, 2024

- Built the platform's Azure usage-optimization engine: 14 waste detection functions (idle VMs, SQL databases, App Services, public IPs, snapshots, load balancers and more) on Azure Resource Graph and Retail Pricing APIs, identifying ~$5.87M a year in waste across commercial and Government tenants.
- Built the orphan-asset engine for cost allocation: finds untagged or mistagged resources and proposes their owning application, attributing ~$1M a year in cost across ~50,000 resources.
- Built data-completeness monitoring for the pipeline: discovers every account that should be scanned, checks each service's expected outputs, and flags missing or incomplete scans on a health dashboard across 30+ microservices.
- Designed and built the team's first GitHub-native CI/CD, replacing Azure DevOps: reusable Bicep templates and GitHub Actions workflows with staged promotion to production for 30+ Azure microservices, secured with managed identities and RBAC on the enterprise landing zone.

Senior Analyst | Aug, 2021 – Dec, 2022

- Designed and built the platform's shared Python SDK over the Azure SDK and moved 30+ microservices onto it, giving every service one standard way to call cloud APIs; now extending it to GCP.

EDUCATION

Indian Institute of Engineering Science and Technology, Shibpur — Jul 2017 – 2021

Bachelor of Technology, Information Technology (CGPA: 8.86/10) ; Class Representative — *Howrah, WB*

SKILLS

- **Skills:** FinOps & Cloud Cost Optimization, Multi-Cloud Architecture, DevOps & CI/CD, IaC, Incident Management, Team Leadership.
- **Technologies:** Azure, GCP, Python, Terraform, Bicep, GitHub Actions, Azure Functions, Cloud Functions, Pub/Sub, BigQuery, Azure Blob Storage, Azure SQL, PowerShell, Linux, Power BI, Claude API, Claude Code, GitHub Copilot.
- **Certifications:** AZ-900, AZ-104.
